

# **HACK MSIT - 19**

## **TEAM - Not Found**

**Theme:** Road Safety

**Problem: -**

When we look around, we can see plenty of stray animals living with us. We love them, sometimes we feed them. But as they live alone and have no one to take care of them, they sometimes fall sick, or starve to death, and worse of all, sometimes they get into some car accident and die, as they are not being rescued or helped. We should not ignore these things. Even though some of us wants to help but are bounded by time or resources.

**Idea (Solution): -**

We will make a web app with a web portal. There will be 2 user cases:

1. NGOs, Animal Hospitals Gaushalas, and other Animal welfare associations, who will register themselves through the web portal.
2. Normal user, who will use the app.

The basic idea is that these NGOs and hospitals will register themselves, and will be a part of the app. And when a user witnesses an animal in need or to be rescued, he/she can use the app. The app will generate a default message and send it to the NGO/hospital operating in that area with the current location of the user. Hence helping the

needy animal on the go. The app will be easy to use with a simple UI, and one-time registration.
